Pseudohypoparathyroidism (PHP) is a rare genetic disorder that affects the way the body uses calcium and phosphorus. This can lead to a variety of symptoms, including muscle weakness, seizures, and developmental delays.

PHP is caused by a mutation in one of several genes involved in the body's calcium and phosphorus metabolism. These mutations can lead to a deficiency of parathyroid hormone (PTH), which is essential for the body to absorb calcium and excrete phosphorus.

PHP is a lifelong condition, but it can be managed with medication and lifestyle changes. Treatment can help to improve symptoms and prevent

complications.

Symptoms of Pseudohypoparathyroidism

The symptoms of PHP can vary depending on the severity of the condition. Some people may only have mild symptoms, while others may have more severe symptoms that require medical treatment.

- Muscle weakness
- Seizures
- Developmental delays
- Intellectual disability
- Short stature
- Dental problems
- Kidney stones
- Cataracts

Diagnosis of Pseudohypoparathyroidism

PHP can be diagnosed with a blood test that measures PTH levels. A blood test can also measure calcium and phosphorus levels.

In some cases, a genetic test may be necessary to confirm the diagnosis of PHP.

Treatment of Pseudohypoparathyroidism

There is no cure for PHP, but treatment can help to improve symptoms and prevent complications. Treatment may include:

- Calcium supplements
- Vitamin D supplements
- Phosphate binders
- Diuretics

In some cases, surgery may be necessary to remove cataracts or kidney stones.

Related Conditions

PHP is often associated with other related conditions, such as:

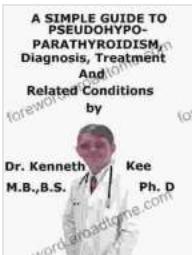

- Albright's hereditary osteodystrophy (AHO)
- Pseudopseudohypoparathyroidism (PPHP)

AHO is a rare genetic disorder that affects the development of bones and teeth. PPHP is a rare genetic disorder that causes similar symptoms to PHP, but the underlying cause is different.

Outlook for Pseudohypoparathyroidism

The outlook for people with PHP varies depending on the severity of the condition. With treatment, most people with PHP can live long and healthy lives.

Pseudohypoparathyroidism is a rare genetic disorder that can cause a variety of symptoms. Treatment can help to improve symptoms and prevent complications. If you think you may have PHP, talk to your doctor.
